41) Questions

- *for those who are present :)*
- software engineers and developers who are interested in learning the Semantic Web technology in general
- future working ontologists
- and users of information retrieval systems in general.

## What is a Web 1.0 ? (1989-2005)

### From contentional viewpoint

HTML 3.2 elements like frames and tables,  
HTML forms get/sent through e-mails,  
content comes from the server's filesystem, not from a RDBMS,  
Encyclopedia Britannica online.

### From technical/technological viewpoint

no user-to-server communication,  
static websites,  
content browsing only,  
hyper-linking and bookmarking pages.

### From contentional viewpoint

offers free information sorting, allowing users to retrieve and classify data collectively, contains dynamic content that responds to the user's input, employs developed APIs, encourages self-usage and allows several forms of interaction (podcasting, social media, blogging, commenting, ...), Wikipedia.

### From technical/technological viewpoint

Web applications introduced, functions such as online documents, video streaming, ... , everything moves online; information and apps are stored on servers, cloud computing operations, centralized data, read/write Web.

## What is a Web 3.0 ? (2006-ongoing)

- 39) References (2)
- 40) References (3)
- 41) Questions

### From contentional viewpoint

AI,  
Machine Learning,  
Natural Language Processing (NLP),  
Internet of Things (IoT),  
the Semantic Web.

### From technical/technological viewpoint

intelligent, web-based functionalities and applications,  
decentralized processes,  
fusion of Web technology and knowledge representation (RDF, RDFs, **OWL, OWL-2**),  
behavioral advertising and engagement,  
live videos,  
semantic searches,  
read/write/control Web.

There's a large amount of website owners who are unaware of the semantic web's importance.

## What is a Web 4.0 ? (2020-?)

- 38) References (1)
- 39) References (2)
- 40) References (3)
- 41) Questions

### From contentional viewpoint

is about mobility and voice interaction between the user and robots.  
symbiotic interaction between man and machine,  
Internet is a Web OS. Information can be transmitted from every part of the world,  
total transparency; all actions are traceable,  
offers higher speed and reliability than ever before.

### From technical/technological viewpoint

?

## What will (probably) be Web 5.0 ? (?-?)

### From contentional viewpoint

Web 5.0 is the *emotional Web*,  
total control over your identity,  
offering true ownership of user data,  
expanded emotional intelligence aspect,  
DAOs\*.

### From technical/technological viewpoint

?

\*DAO (Decentralised Autonomous Organisation) is an organisation governed by a set of rules or parameters encoded in a computer program and controlled by the users of the program rather than a central authority.

## Back to Web 3.0: Advantages/Disadvantages of the Semantic Web (Web 3.0)

Possessing huge quantities of **data, information, and knowledge**

which is **translated to be comprehensible** and ready for including

virtual assistants,  
software agents,  
and AI bots\*.

The main three problems, when using the Web 3.0

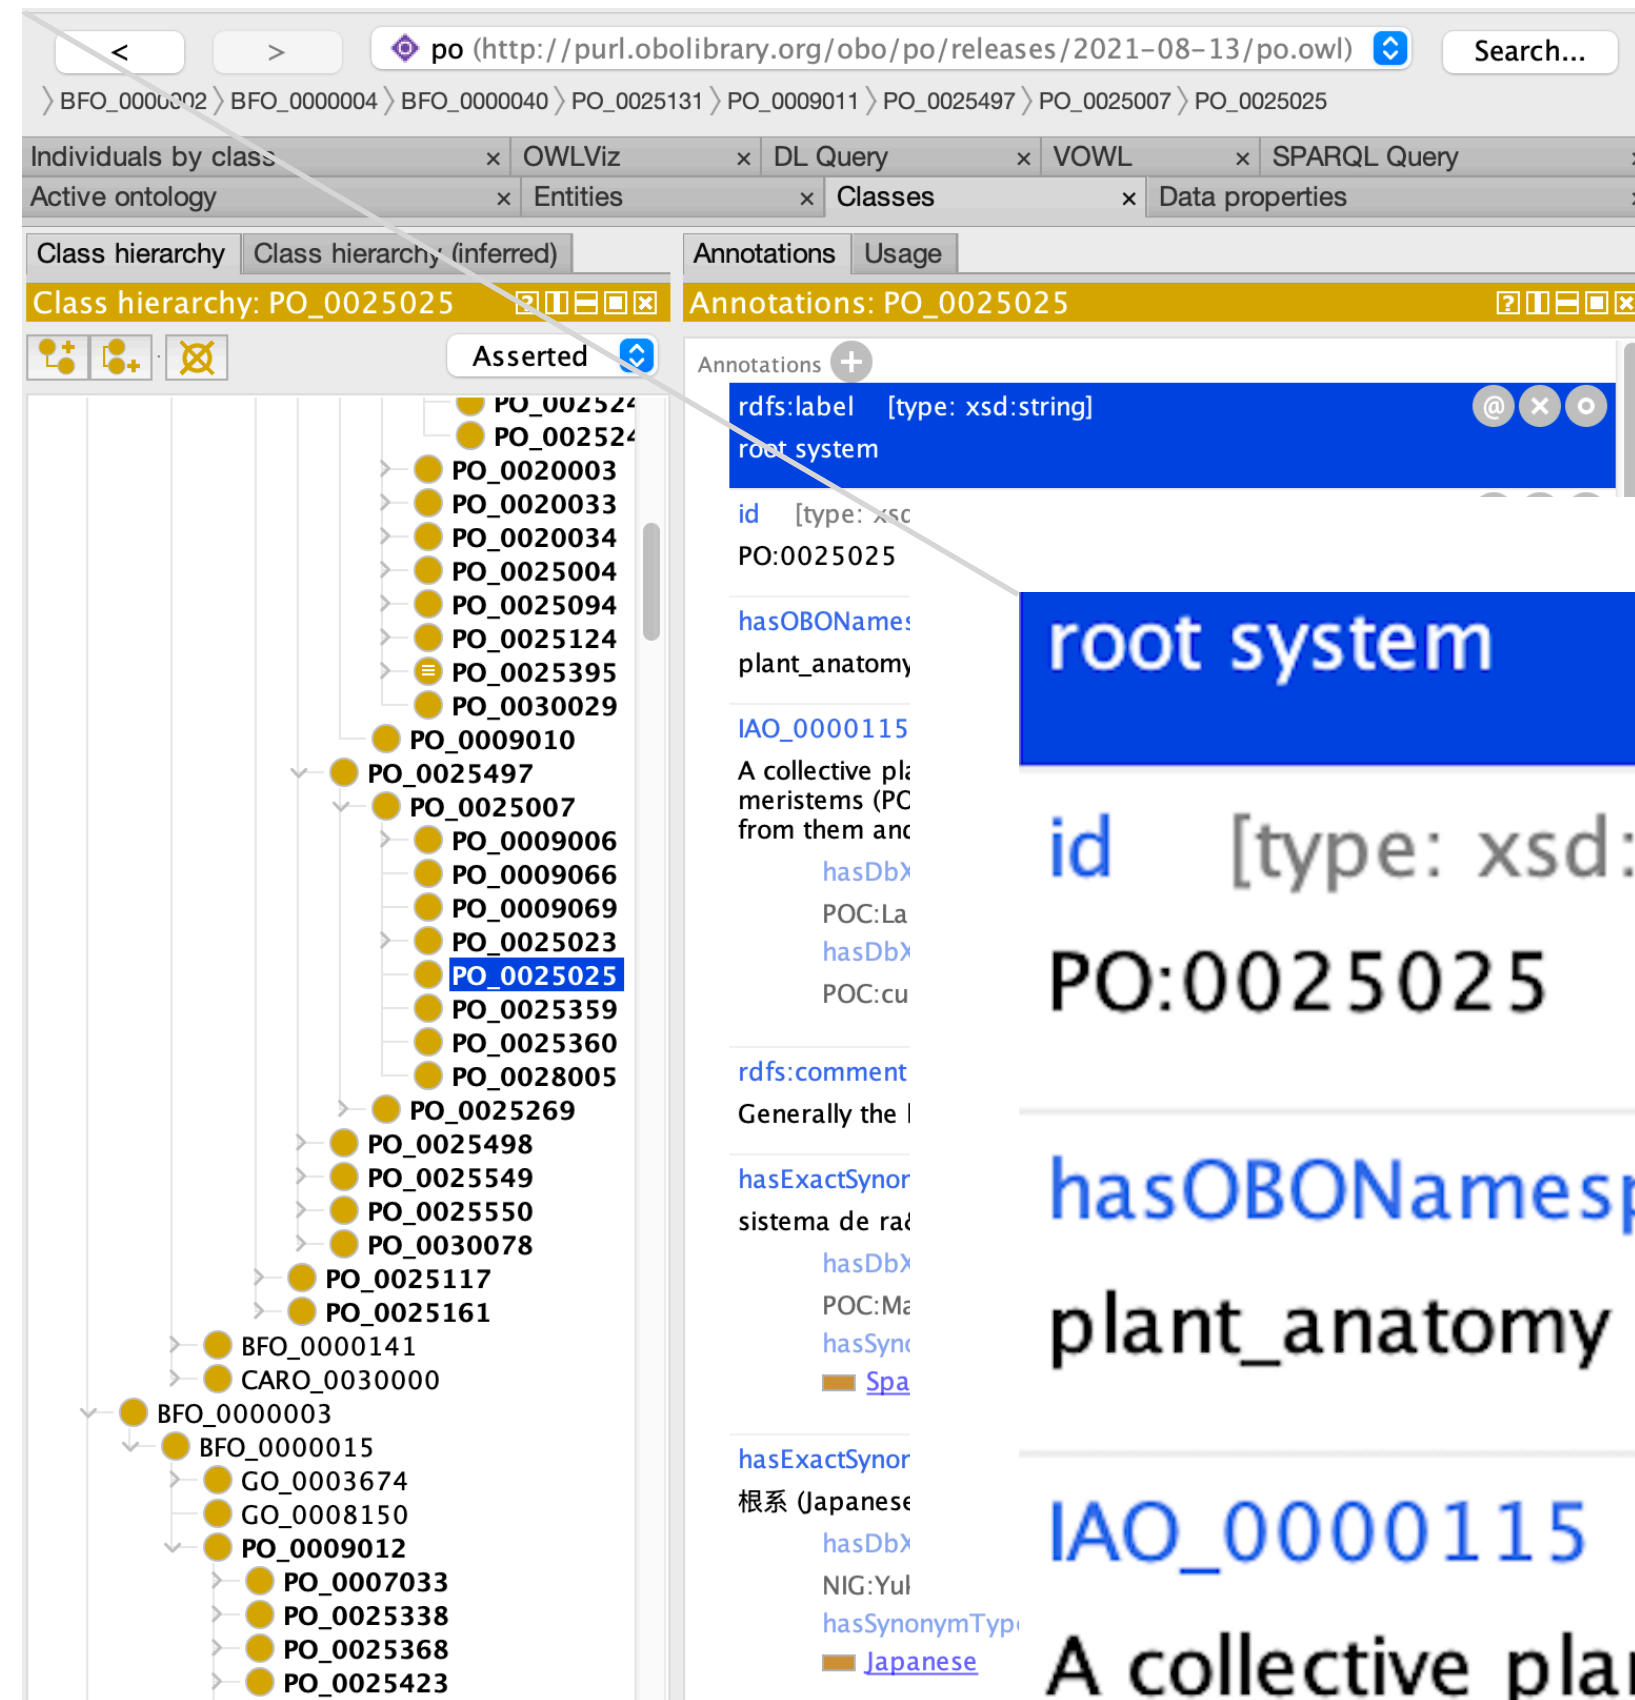

it is very new and there are very few resources available to help us learn and use it,  
it quite complex and there are many different ways to use it,  
it is very buggy and there are many ways to make mistakes while using it.

\* AI (ro)bots are self-learning bots that are programmed with Natural Language Processing (NLP) and Machine Learning. A chatbot system uses conversational artificial intelligence (AI) technology to simulate a discussion (or a chat) with a user in natural language via messaging applications, websites, mobile apps or the phone.

## Ontology in Praxis: Class in Protégé

**Protégé** is a free, open-source ontology editor and framework for building intelligent systems.

**root system**

**id** [type: xsd:string]

PO:0025025

**hasOBONamespace** [type: xsd:string]

plant\_anatomy

**IAO\_0000115** [type: xsd:string]

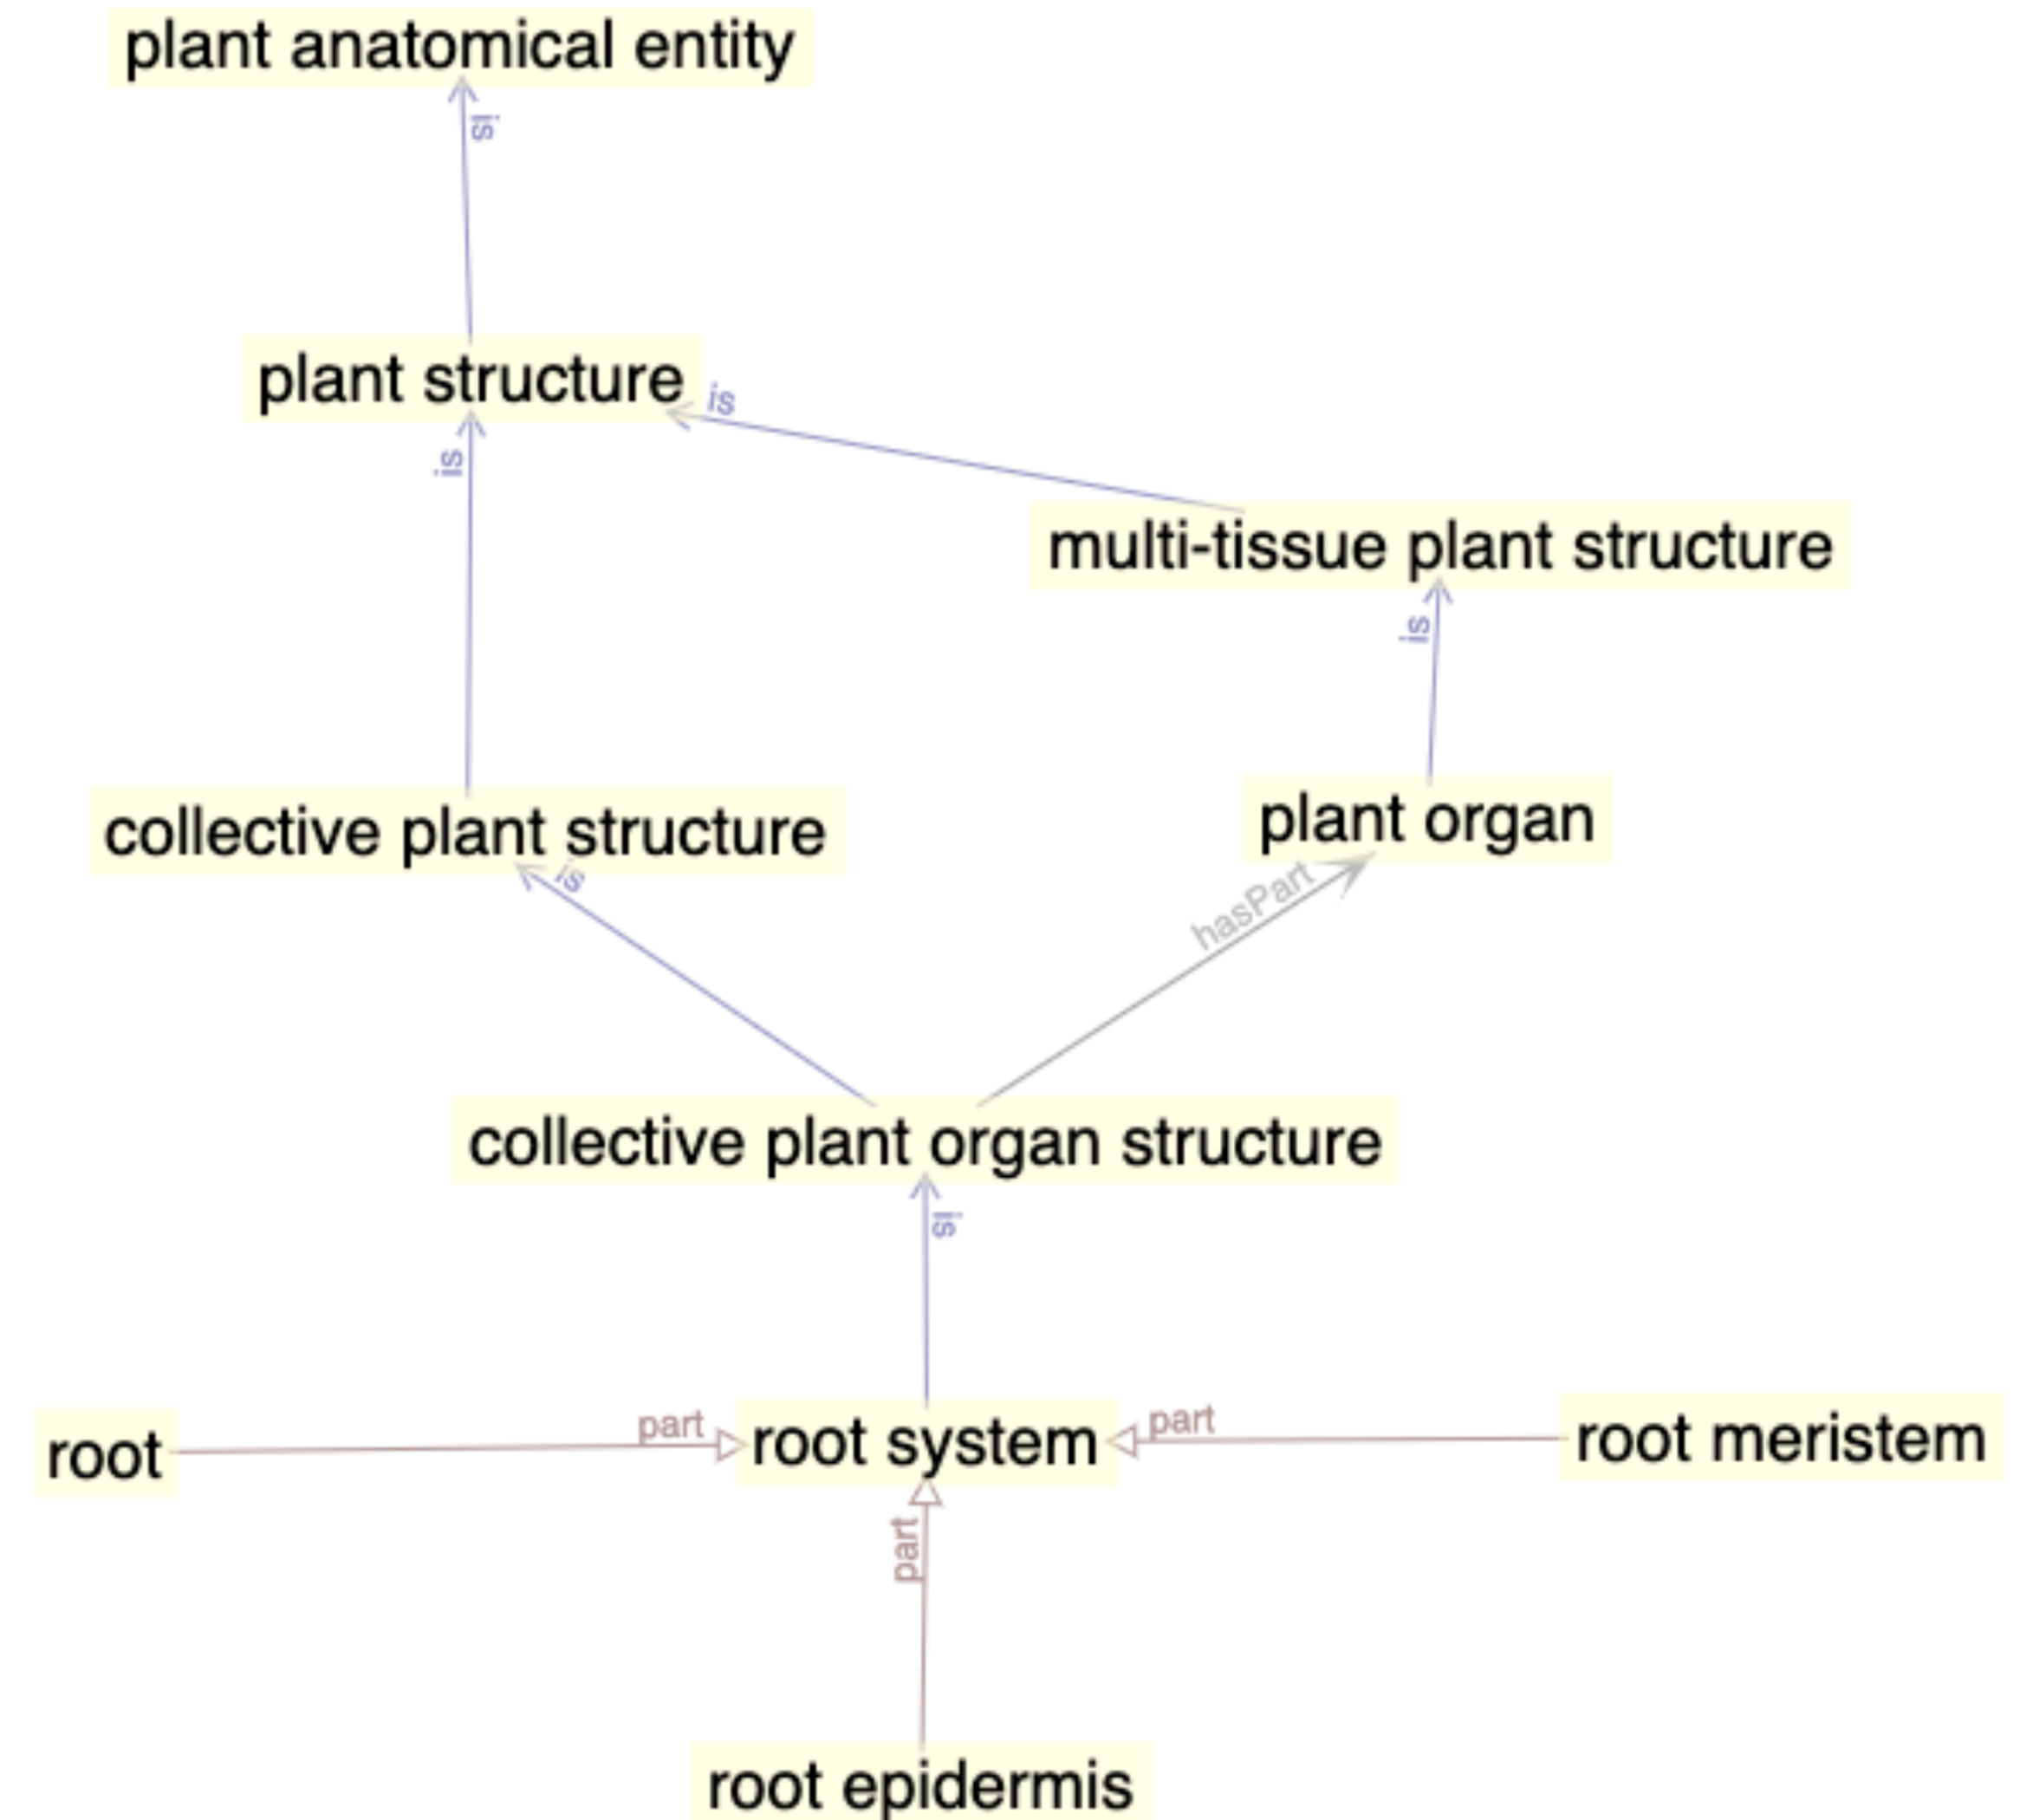

A collective plant organ structure (PO:0025007) that produces root meristems (PO:0006085), the plant structures (PO:0009011) that arise from them and the parts thereof.

## Ontology in Praxis: Class in OLSVis (2)

[OLSVis](#) is an animated, interactive visual browser for bioontologies

More than one million terms from biomedical ontologies and controlled vocabularies are available through the Ontology Lookup Service (OLS).

OLSVis Plant Ontology (Structure, Growth and Develc

• roots + filters glume

### *root system* (PO:0025025)

A collective plant organ structure (PO:0025007) that produces root apical meristems (PO:0020147) and the plant structures that arise from them.

broad synonym:	root
japanese synonym:	根系 (Japanese)
spanish synonym:	sistema de raíz (Spanish)
comment:	Generally the below ground portion of a vascular plant.
subset TraitNet:	Plant Functional Traits
xref definition:	POC:curators

### Child terms:

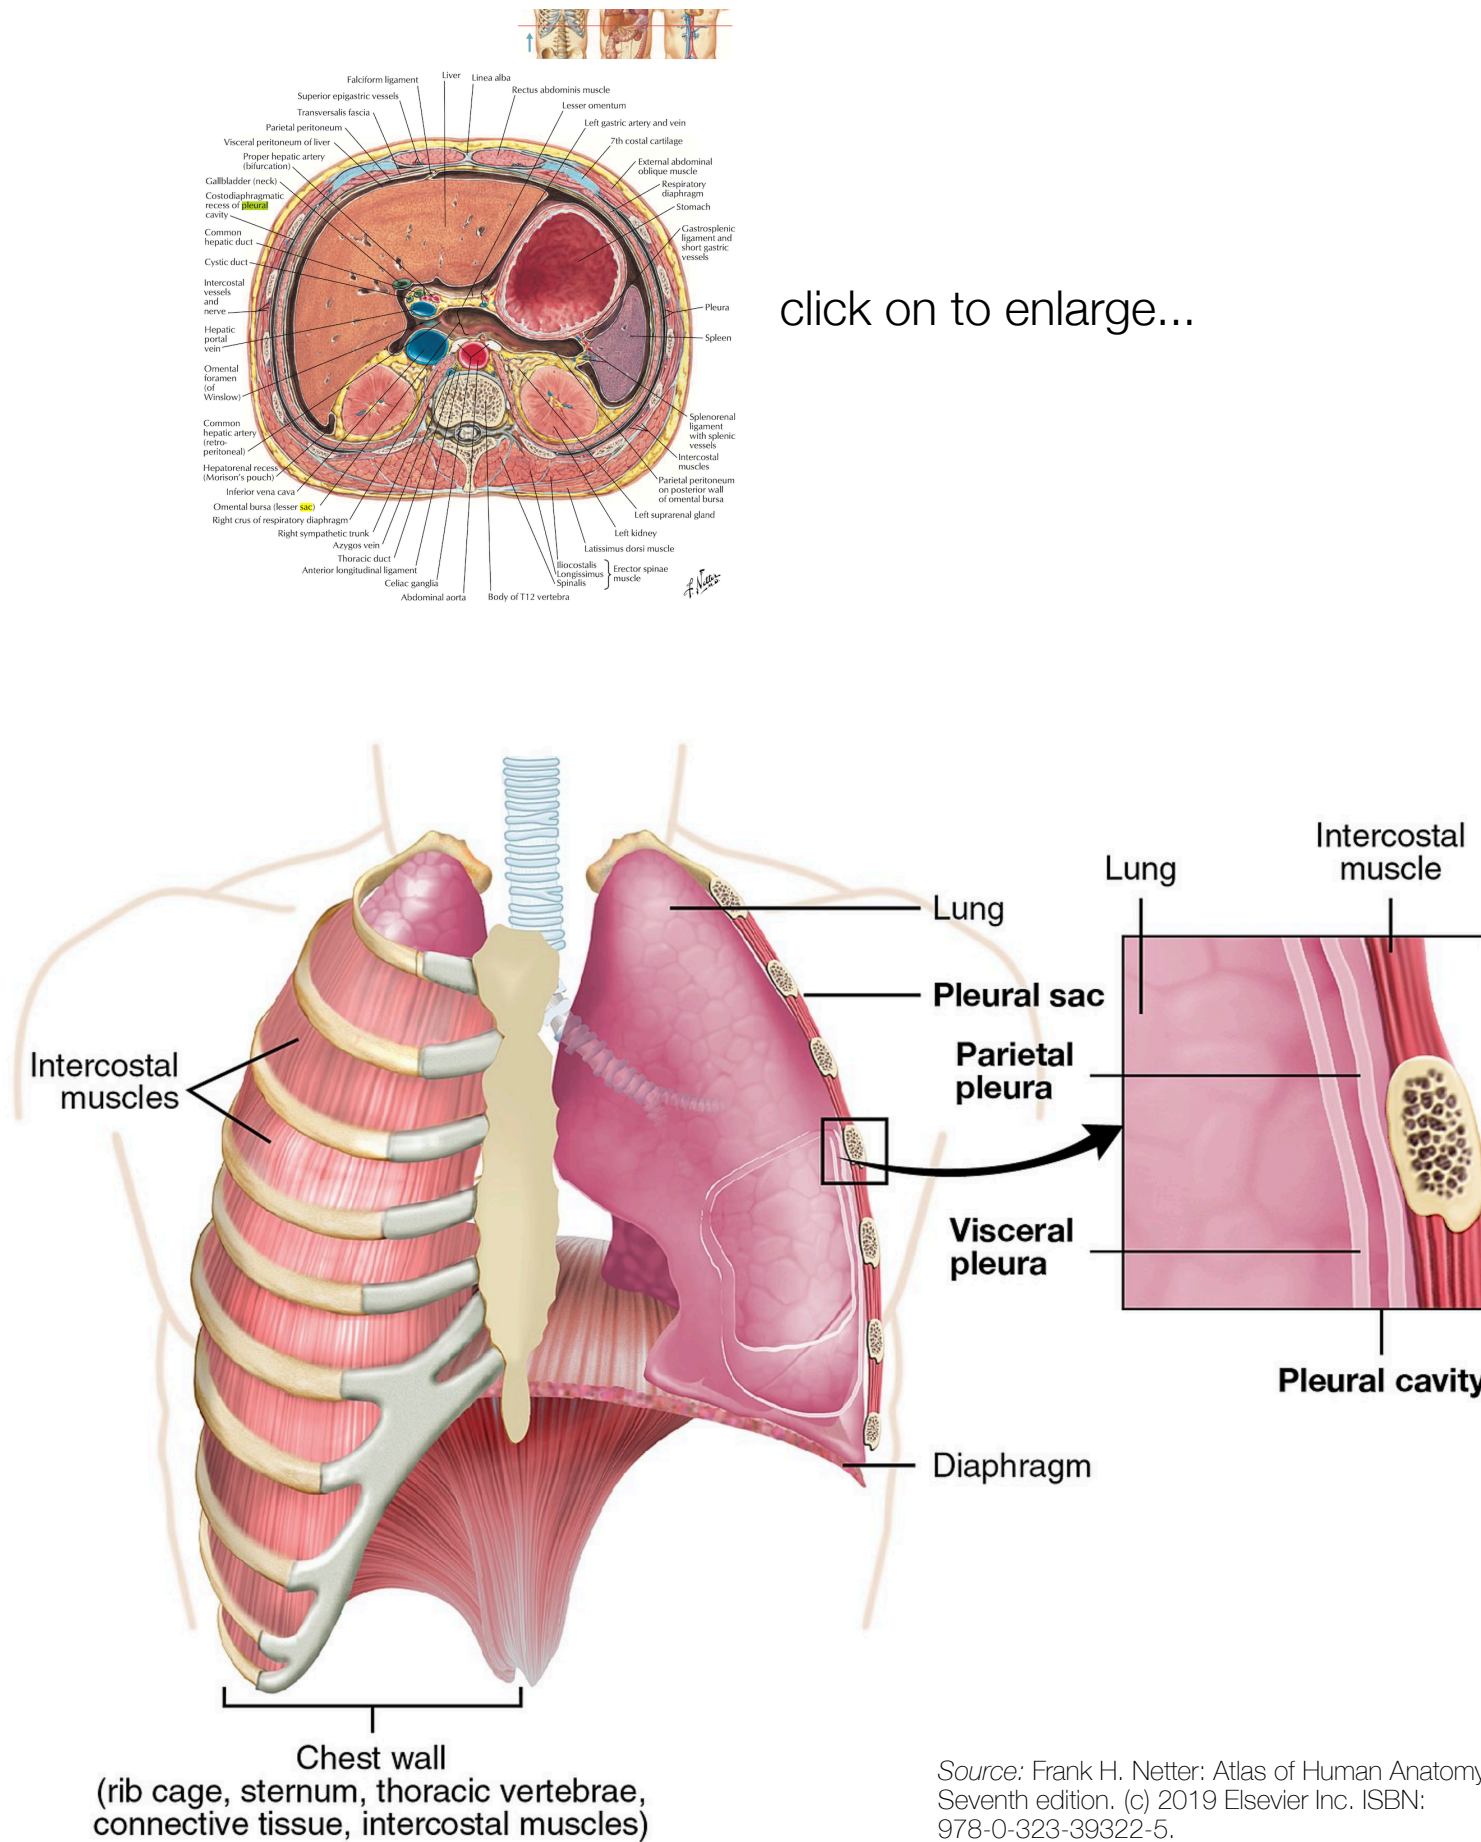

- root
- root epidermis
- root meristem

### Vocabulary

- domain-independent logical symbols and reserved terms,
- domain-dependent constants, identifying individuals, properties or relations,
- variables, whose range is governed by quantifiers,
- punctuations that separate or group other symbols.

### Syntax

- Rules for combining the symbols into well-formed expressions.

### Semantics

- A theory of reference that determines how the constants and variables are associated with things in the universe of discourse.

### Taxonomy

- a scheme of classification,
- methodology and principles of systematic ordering and sets up arrangements of the kinds of the artifacts in hierarchies of superior and subordinate groups.

### Ontology

- conceptual model of some aspect of a particular universe of discourse,
- ontology is the study of beings or their being—what is.

### Epistemology

- the theory of knowledge, especially with regard to its methods, validity, and scope, and the distinction between justified belief and opinion.

## Ontology versus Epistemology

Stanford  
Encyclopedia  
of Philosophy

Ontology is concerned with what is true or real, and the nature of reality

Asks questions like “*What is existence?*” and “*What is the nature of existence?*”

Epistemology is concerned with the nature of knowledge, and different methods of gaining knowledge

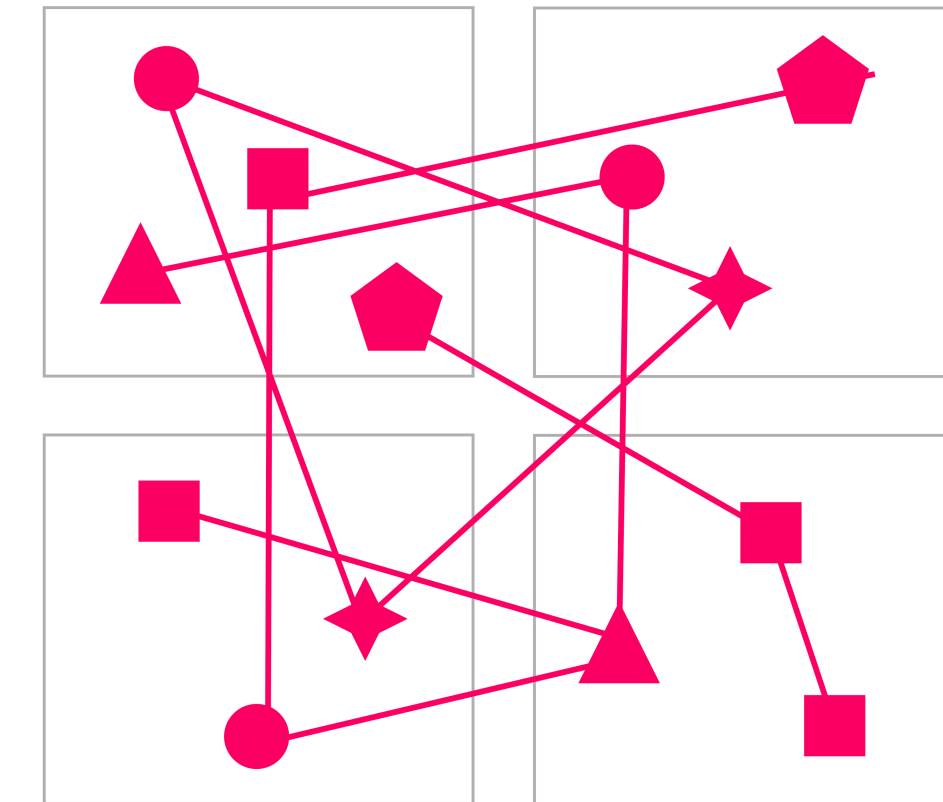

Asks questions like “*What do you know?*” and “*How do you know it?*”

### Ontology versus Taxonomy

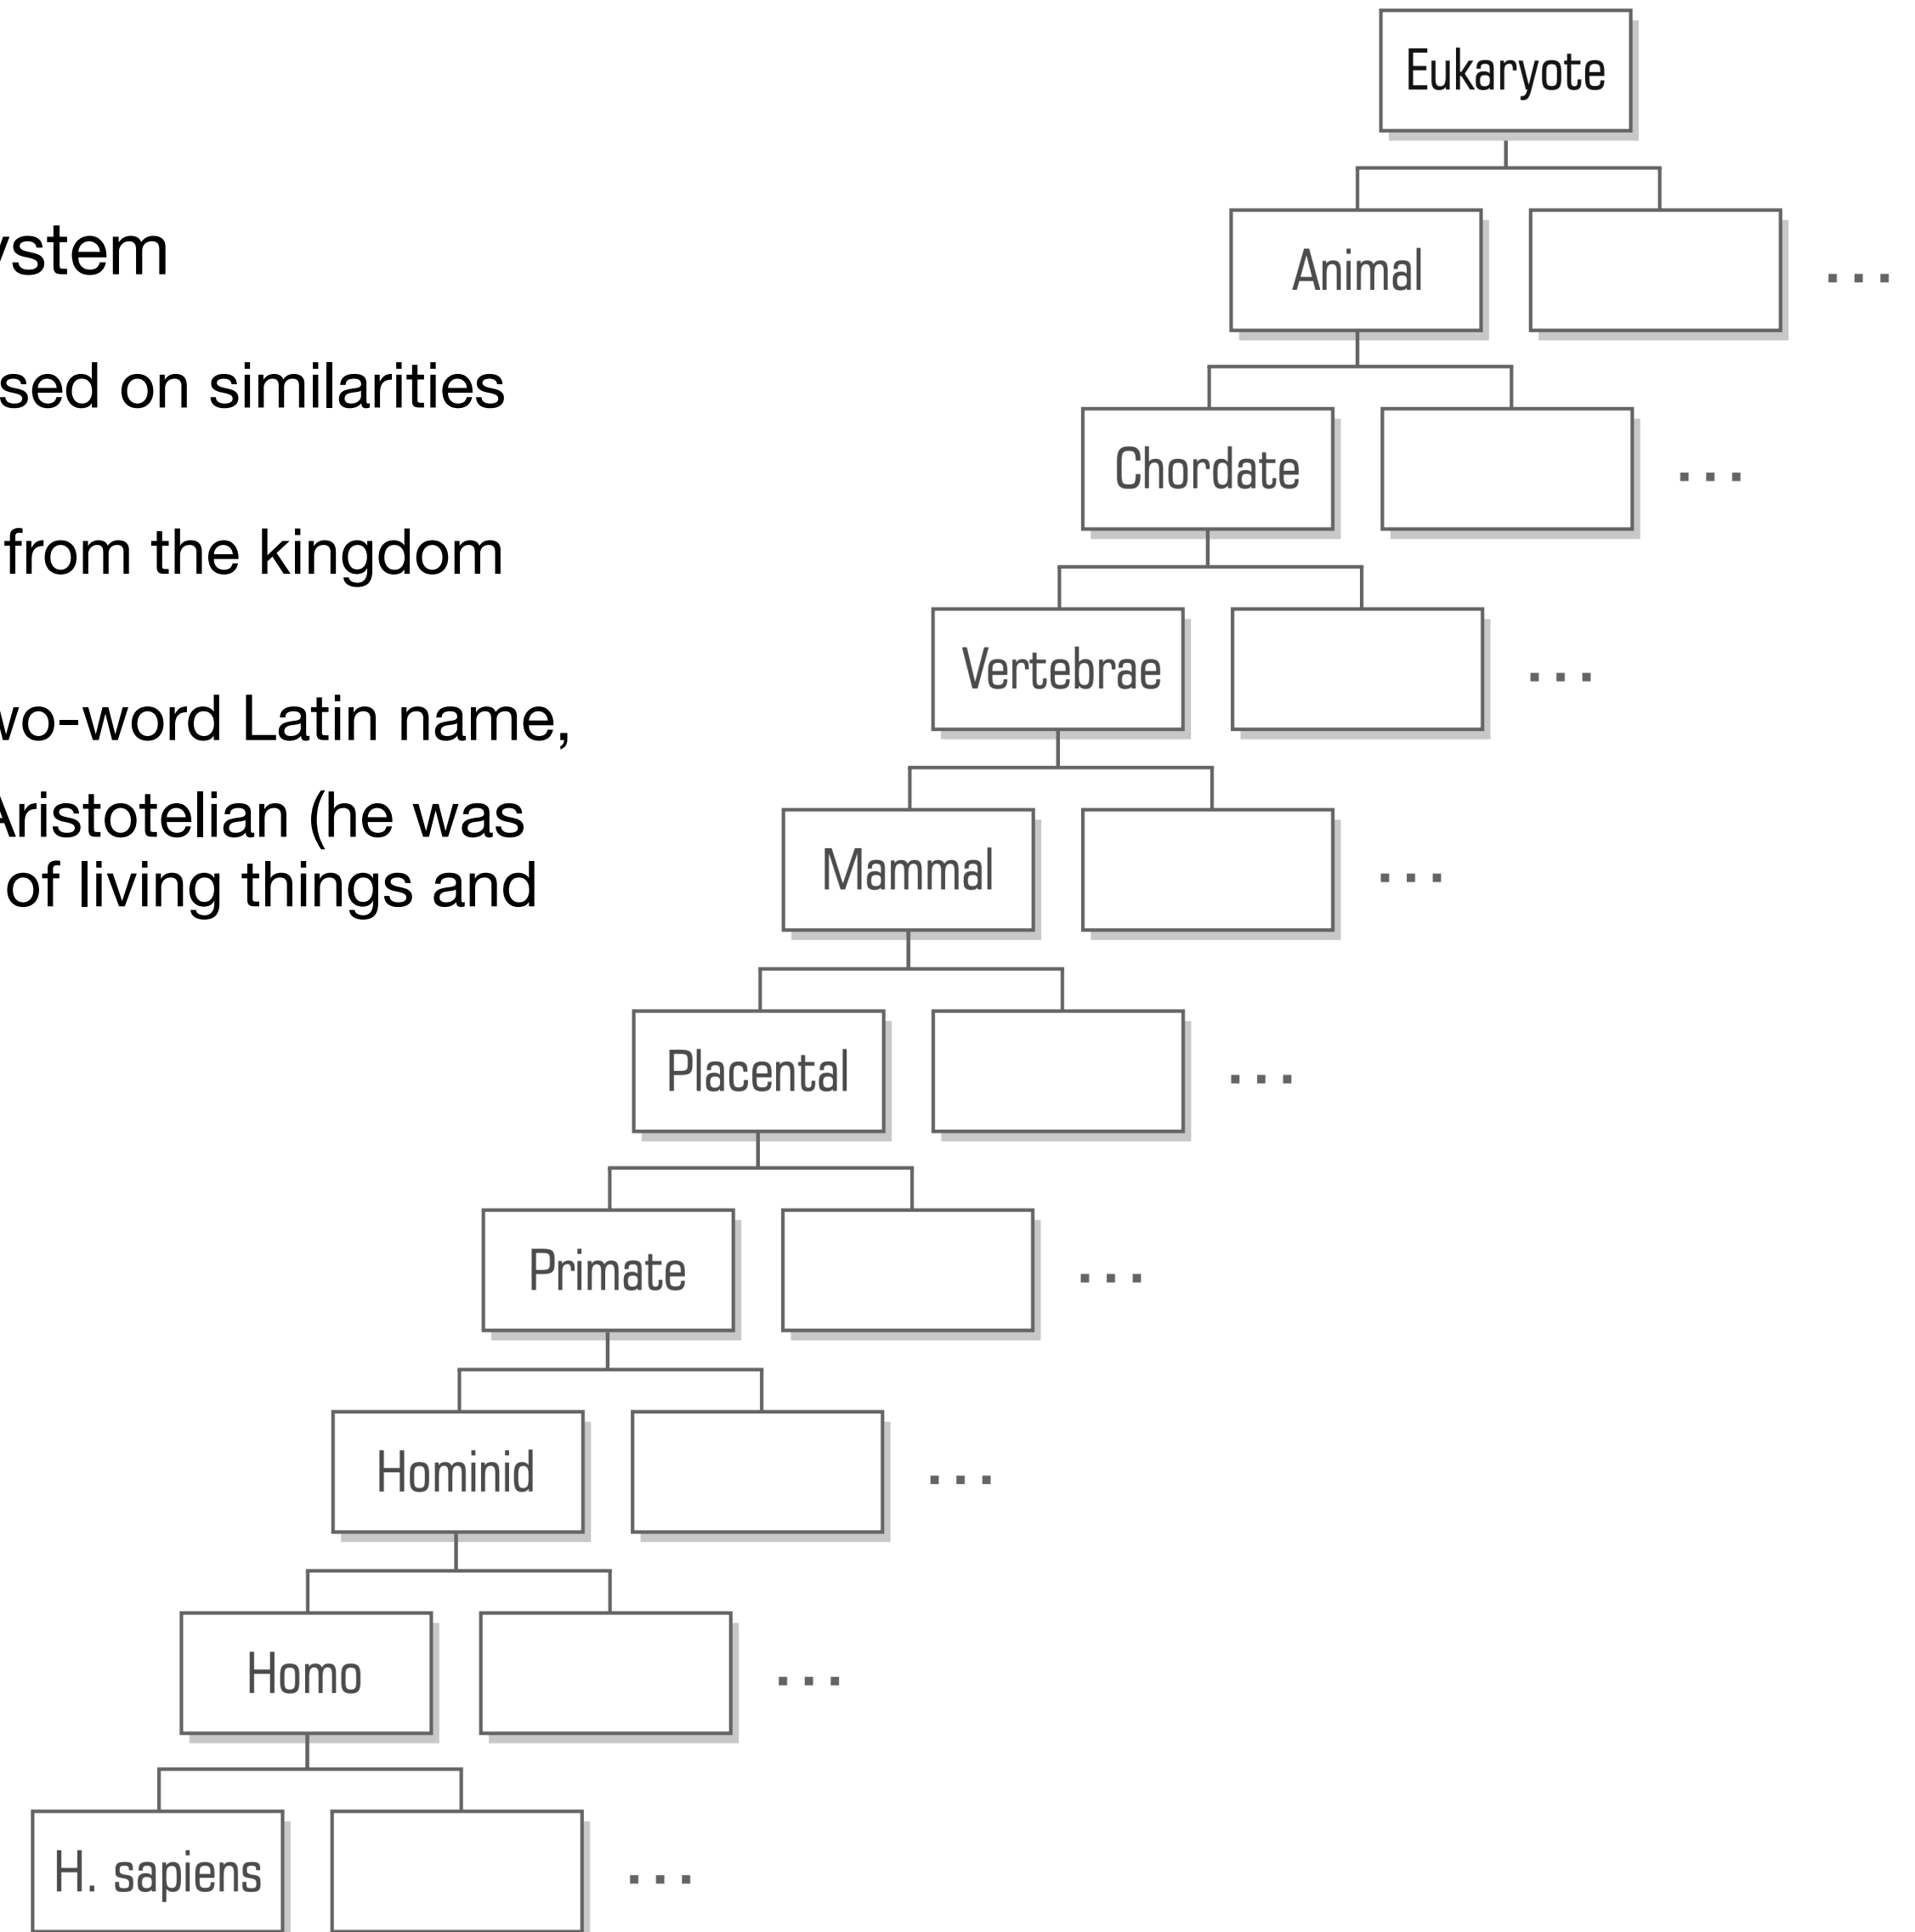

- ontologies allow **multidimensional relationships** to be defined,
  - an ontology identifies and distinguishes concepts and their relationships,
  - ontologies achieve a **higher level of sophistication** by providing richer information, including information about the **relationships among entities**.
- 
- a taxonomy is a form of classification scheme,
  - the taxonomy identifies **hierarchical relationships** within a category,
  - each taxonomy is **designed to categorize items** within just one dimension.
  - a taxonomy is a kind of knowledge map,
  - a taxonomy formalizes the hierarchical relationships among concepts.

## Basic Terms (4)

### Sample Taxonomy: the Linnaean system

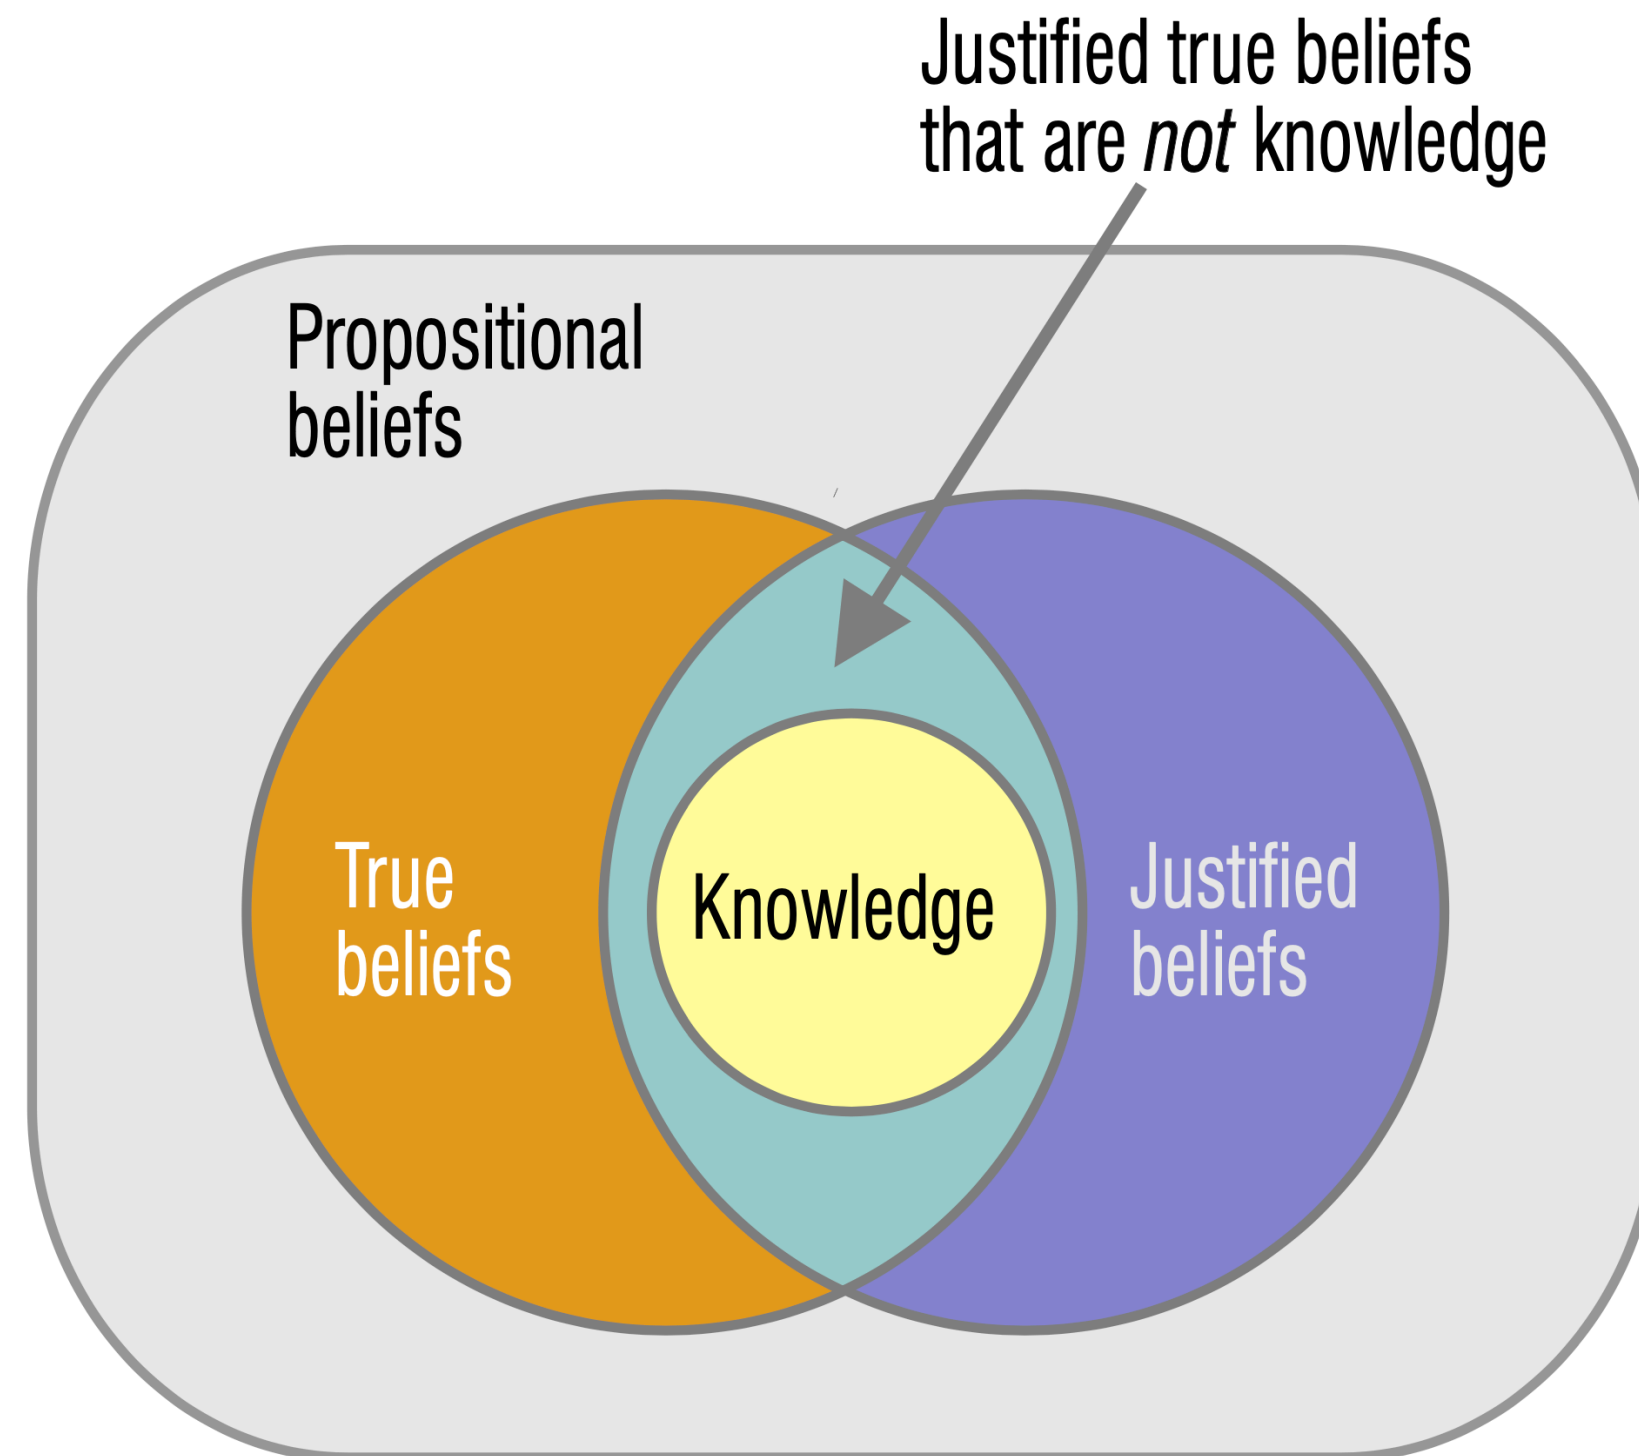

- the Linnaean system (1758) is based on similarities in obvious physical traits,
- it consists of a hierarchy of taxa, from the kingdom to the species,
- each species is given a unique two-word Latin name,
- Carolus Linnaeus' concept was Aristotelian (he was the idea of the essential features of living things and his logic).

### What is knowledge ?

### Critics of Justified-True-Beliefs (JTB) Theory Edmund Gettier (1963)

Situation: A ball in front of me appears to be red

- 1) I **b**elieve it is red.
- 2) I'm **j**ustified in this belief, the ball appears red to me.
- 3) It's also **t**ruelike that the ball is red.

However, it turns out that the ball is illuminated by a red light, a fact that I'm unaware of. Under the red each colour would appear red, but I made a lucky guess anyway :)

Facit: **The JTB conditions are fulfilled**, but JTB definition of knowledge is seriously flawed.

## Inferential Chains\*

- infinite inferential chain,
- circular inferential chain,
- inferential chains terminating in belief not constituting knowledge,
- inferential chains terminating in knowledge
  - the last link must be
    - non-inferential,
    - direct (from perception, memory, introspection, or from testimony)
  - expressing otherwise:
    - the last link must be direct knowledge, knowledge *not based on* other knowledge (or on justified belief)

## Basic Terms (8)\*

### Common Logical Fallacies

- 1) **The False Dilemma Fallacy** (e.g.: "We can either agree with Barbara's plan, or just let the project fail. There is no other option.")
- 2) **The Correlation/Causation Fallacy** (e.g.: "If two things appear to be correlated, this doesn't necessarily indicate that one of those things irrefutably caused the other thing.")
- 3) **Temporality is not causality** (e.g.: "Post hoc ergo propter hoc - Since event Y followed event X, event Y must have been caused by event X")
- 4) **Fallacy of division** (e.g.: Dogs are frequently encountered in the streets.  
Afghan hounds are dogs.  
Therefore Afghan hounds are frequently encountered in the streets.
- ...
- 100) **The Personal Incredulity Fallacy** (If you have difficulty understanding how or why something is true, that doesn't automatically mean the thing in question is false.)

### RDF

- the Resource Description Framework (RDF) is a general framework for representing interconnected data on the web,
- RDF statements are used for describing and exchanging metadata, which enables a standardized exchange of data based on relationships,
- RDF is used to integrate data from multiple sources,
- the semantic web is based on the use of the RDF framework to organize information,
- the **RDF triple** contains three components: the *subject*, the *predicate*, and the *object*; **each component is an RDF URI reference**

### RDFS

- the Resource Description Framework Schema is a vocabulary for describing properties and classes of RDF resources,
- RDFS is an extensible knowledge representation language, providing basic elements for the definition of ontologies.

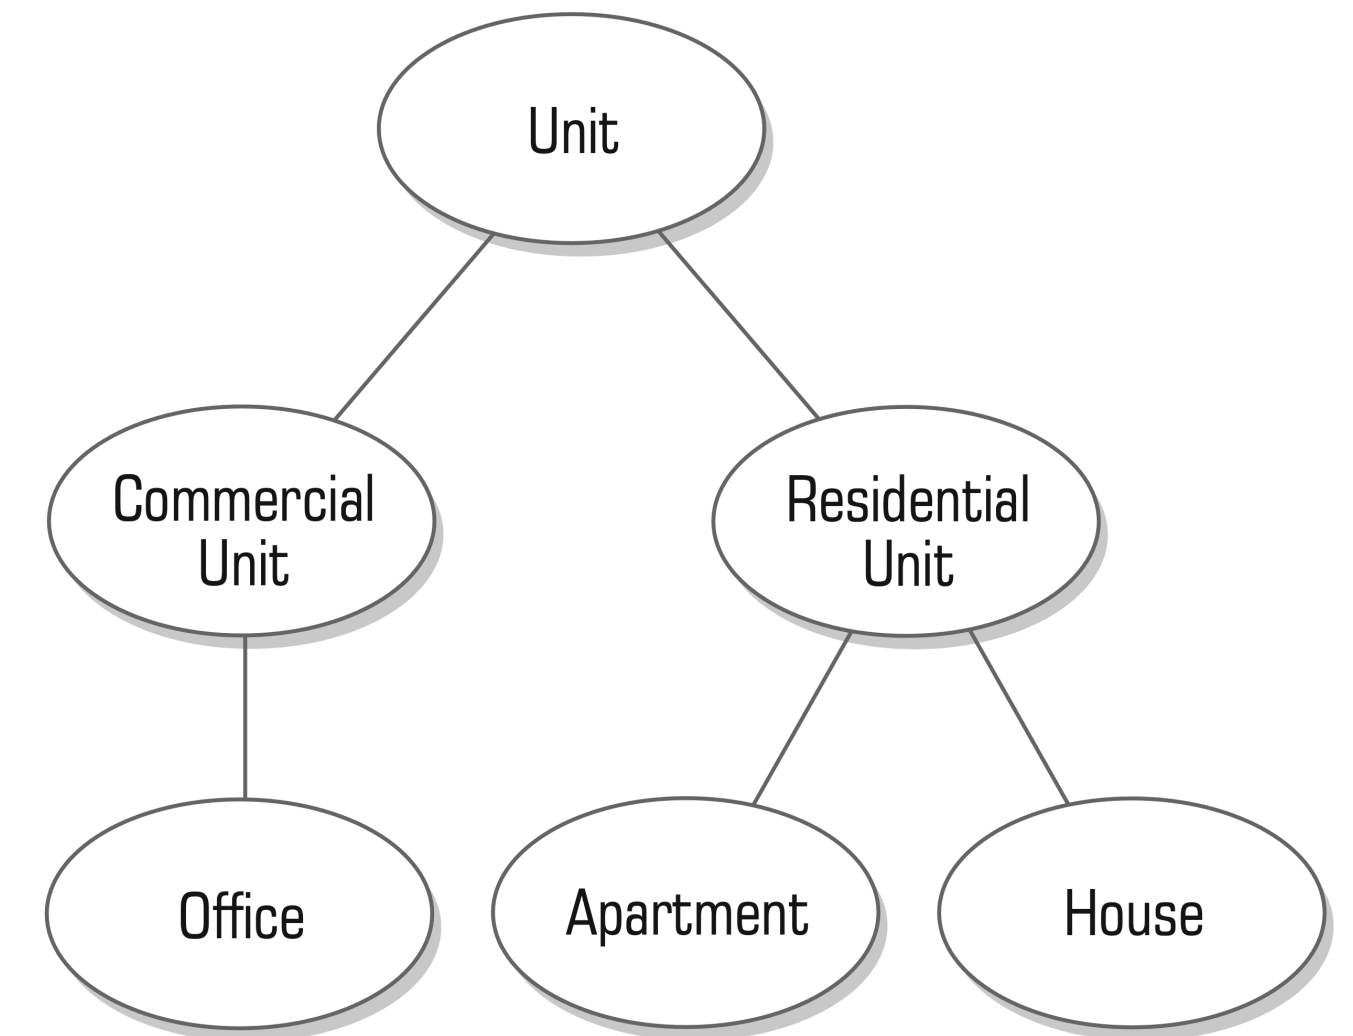

### RDFS classes

- it corresponds in RDF Schema to the generic concept of a type or category (like the notion of a class in OO languages)
- class C is defined by a triple of the form  
`C rdf:type rdfs:Class.`

### RDFS core classes

- `rdfs:Resource`, the class of all resources
- `rdfs:Class`, the class of all classes
- `rdfs:Literal`, the class of all literals (strings)
- `rdf:Property`, the class of all properties
- `rdf:Statement`, the class of all reified statements

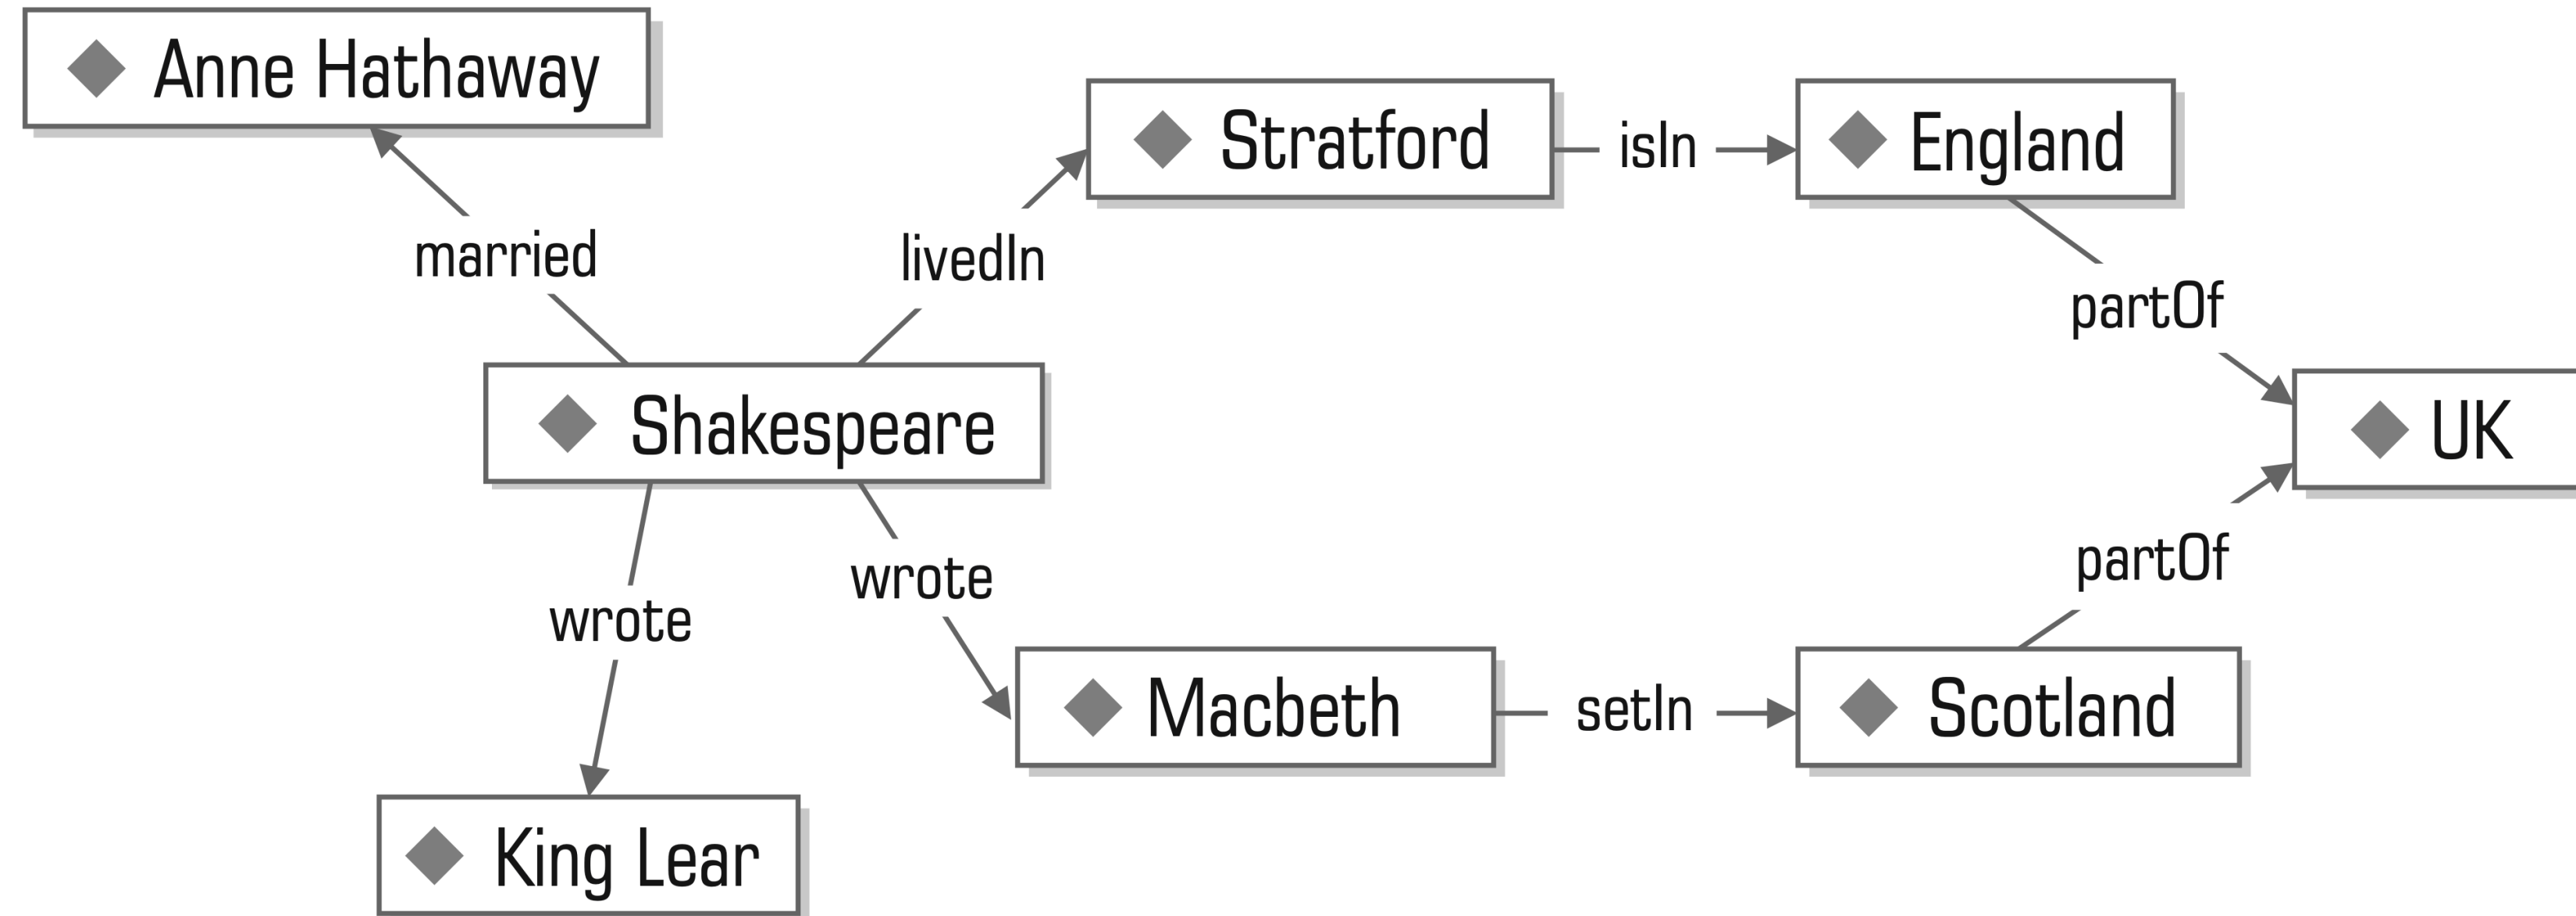

example of classes

## RDF Query Language: SPARQL (1)

SPARQL\* is an RDF query language: a semantic query language for databases,- able to **retrieve** and **manipulate data** stored in Resource Description Framework (RDF) format.

*"Trying to use the Semantic Web without SPARQL is like trying to use a relational database without [SQL](#)."* (Sir Tim Berners-Lee, Director of W3C)

There are several other (far less important) RDF query languages, as well:

GraphQL,  
Gremlin,  
KGSQL,  
RDQL,  
SquishQL,  
TriQL,  
TMQL,  
XUL, ...

\*SPARQL : Simple Protocol and RDF Query Language.  
Version 1.0 was acknowledged by W3C on 15 January 2008

## RDF Query Language: SPARQL (2)\*

### Different representations of the RDF data

RDF is concerned with informational content  
XML, Turtle, JSON, ... is concerned with serialization

Graphical form

Triple

**subject**    **predicate**    **object**

Alternative terminology

**resource**    **property name**    **property value**

Relational form

**predicate(subject, object)**

RDF/XML encoding

```
<rdf:Description rdf:about="subject">
  <ex:"predicate">
    <rdf:Description rdf:about="object"/>
  </ex:"predicate">
</rdf:Description>
```

\*Turtle encoding

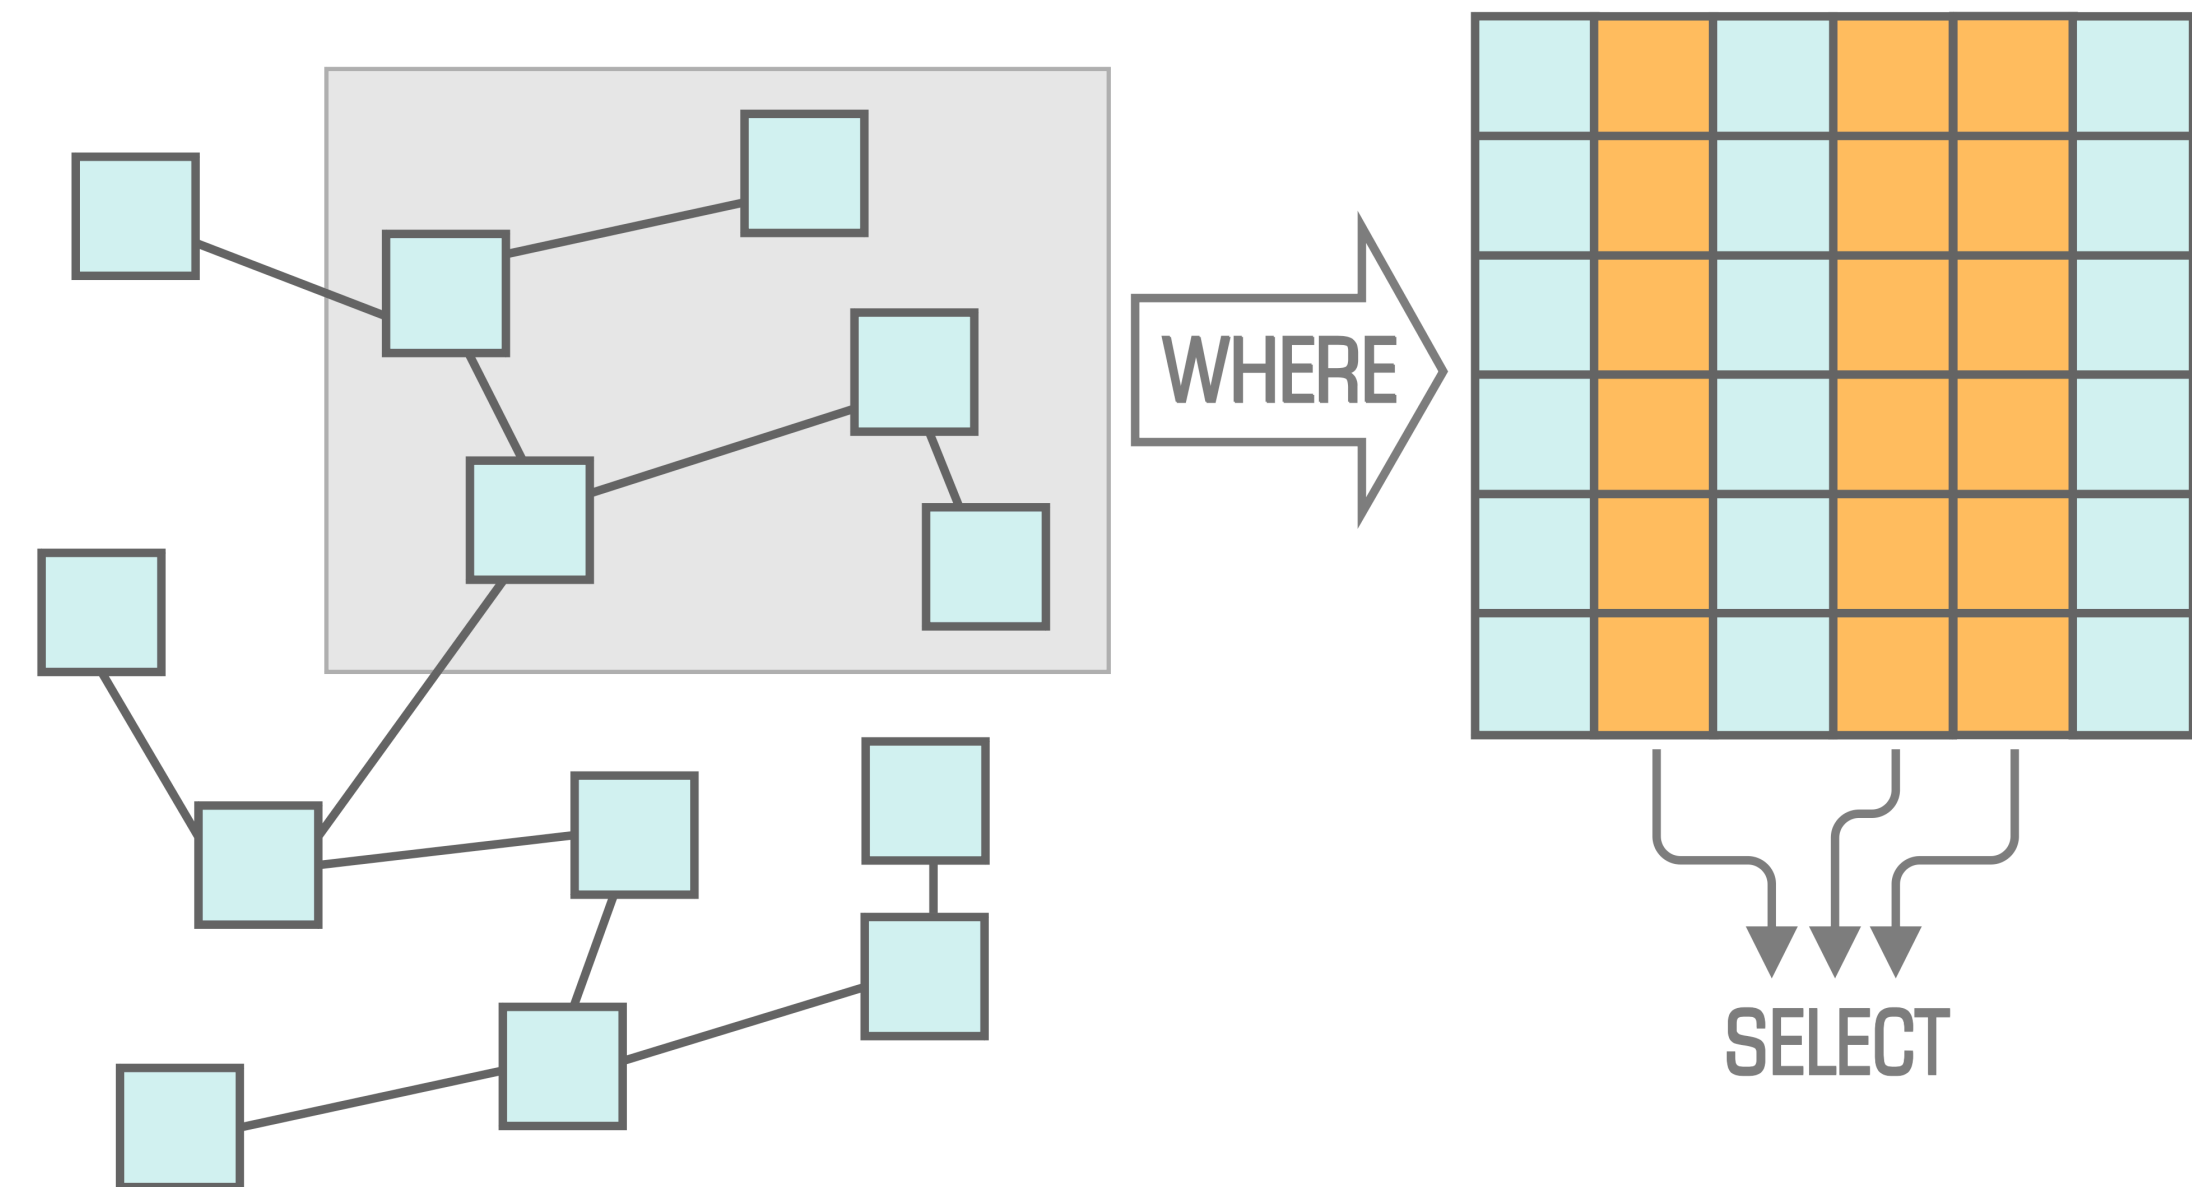

**subject predicate object .**

\*Turtle : Terse RDF Triple Language.

## RDF Query Language: SPARQL (3)

The SPARQL query's **WHERE** clause specifies "*pull this data out of the dataset,*" and the **SELECT** part names which parts of that pulled data you actually want to see.
